

Computational Economics with Python

Columbia University March 2018

John Stachurski

Lecture 1

Set up and Resources

Follow the instructions here

- https://github.com/QuantEcon/columbia_mini_course

Steps

1. Install Anaconda Python
2. Update Numba via conda `install numba=0.37`
3. Download files from GitHub repo

Assumptions / Prerequisites

- Coding experience assumed
- No Python required

Course Structure

Day 1: The Core Language

- Python syntax and semantics
- OOP design
- Functions, flow control, etc.
- Classes — DYI objects

Day 2: Scientific Computing

- NumPy / SciPy / Matplotlib
- JIT compilation with Numba
- Multithreading techniques
- Distributed computing

Day 3: Applications

- Asset pricing
- Optimal savings
- Optimal stopping (job search)

Programming Background — Software

A common classification:

- **low** level languages (assembly, C, Fortran)
- **high** level languages (Python, Ruby, Haskell)

Low level languages give us fine grained control

Example. $1 + 1$ in assembly

```
pushq    %rbp
movq     %rsp, %rbp
movl     $1, -12(%rbp)
movl     $1, -8(%rbp)
movl     -12(%rbp), %edx
movl     -8(%rbp), %eax
addl     %edx, %eax
movl     %eax, -4(%rbp)
movl     -4(%rbp), %eax
popq     %rbp
```

High level languages give us abstraction, automation, etc.

Example. Reading from a file in Python

```
data_file = open("data.txt")
for line in data_file:
    print(line.capitalize())
data_file.close()
```

Jane Street on readability:

There is no faster way for a trading firm to destroy itself than to deploy a piece of trading software that makes a bad decision over and over in a tight loop.

Part of Jane Street's reaction to these technological risks was to put a very strong focus on building software that was easily understood—software that was readable.

– Yaron Minsky, Jane Street

Python vs other popular high level languages

Trade-Offs

But what about scientific computing?

Requirements

- Productive — easy to read, write, debug, explore
- Fast computations

Trade-Offs

Trade-Offs

Trade-Offs

Programming Background — Hardware

CPU frequency (clock speed) growth is slowing

Chip makers have responded by developing multi-core processors

Source: Wikipedia

Exploiting multiple cores / threads is nontrivial

Sometimes we need to redesign algorithms

Sometimes we can use tools that **automate** exploitation of multiple cores

Distributed/Cloud Computing

Advantages: run computationally intensive code on big machines we didn't have to buy

Options:

- University machines
- AWS and other commercial services

Jupyter notebooks

A browser based interface to Python / Julia / R / etc.

Can be opened through Anaconda navigator

Or via a terminal:

Step 1: Open a terminal

- on Windows, use Anaconda Command Prompt

Step 2: type `jupyter notebook`

- opening a notebook
- executing code
- edit / command mode
- everything's an object (lists, strings)
- installing quantecon
- getting help
- introspection
- math and rich text
- Jupyter lab

Notebooks

- `day1/python_by_example.ipynb`
- `day1/python_essentials.ipynb`
- `day1/python_foundations.ipynb`
- `day1/python_oop.ipynb`

Homework

HW 1. The notebook `day1/supply_and_demand.ipynb` contains poorly organized code

In particular there is repetition of logic, a sin against good software engineering principles

Use functions or classes to clean it up

Your solution should minimize repetition
